

Jialin Huang

Frontend Engineer

linao264590000@gmail.com [LinkedIn](#) [GitHub](#) jialin00.com

Frontend engineer with eight years across six industries, now on the platform side of a multi-tenant enterprise security product. There I migrated console pages onto React and drove the monorepo cleanup the whole team builds on. Earlier I tuned rendering performance on a high-traffic news site.

EDUCATION **National Chengchi University (NCCU)** · B.A. in Economics

EXPERIENCE

MammothCyber Senior Full Stack Engineer

Apr 2025 - Present · Cybersecurity · Taipei (Hybrid)

Full-stack across the web portal of a multi-tenant enterprise security platform, a Chromium-based secure browser, and Go services; security domain (access control, audit, policy config)

REACT NEXT.JS REMIX VUE POSTGRESQL DOCKER KUBERNETES JENKINS AWS LAMBDA AWS COGNITO

Console Migration to Remix

- Migrated console pages onto Remix (React 18, Mantine, TanStack Query/Table, Vite) off an earlier Vue / Next.js stack, page by page with new and old running side by side

Policy Configuration Console

- Built the rules and content-profile editor in Remix, type-safe end to end with reactive validation

Secure Browser & Extension (Chromium)

- Shipped a login / session-visibility feature across every client of a Chromium-based enterprise browser, extending each platform's native bridge in C++ (Android / Desktop) and Objective-C++ (iOS), plus a Go fetch backend and a React UI
- Built the login dialog in the companion Chrome extension (React / Redux), surfacing device info and recent failed logins

Identity, Access & Audit

- Integrated Google / Apple social login into Cognito on top of the existing SAML, reconciling the OAuth scopes for external IdPs and reworking several Cognito Lambda triggers, including the PreTokenGeneration hook that maps each social user to its tenant

Platform & Build Infrastructure

- Drove a monorepo dependency cleanup on npm: root overrides and targeted upgrades (Express v5, Apollo Server v5, ESLint v9) cut vulnerabilities 74 → 13 (-82%), clearing every high & critical, and stray local packages 22 → 0
- **npm to pnpm**: Migrated the monorepo to pnpm workspaces with a staged rollout (shamefully-hoist bridge, declare every phantom dep, flip to strict isolation), cutting installs 3-10x and making per-worktree installs cheap so parallel AI agents can each build in their own git worktree
- Cut two Docker images ~80% with bundling and pnpm deploy --prod: Remix web app 1.88 GB → 264 MB, NestJS API 1.95 GB → 490 MB; compressed registry size ~540 MB → 89 MB (-84%) and 628 MB → 180 MB (-71%)

Bunastar Frontend Engineer

Nov 2024 - Apr 2025 · Gaming · Taipei (Hybrid)

Real-time multiplayer card game for the Southeast Asian market; custom Canvas engine and WebSocket sync

REACT CANVAS EGRET GOOGLE ANALYTICS

Southeast Asian Gaming Platform - Pok Deng

- Card game logic: betting, dealing, scoring, payout
- Canvas rendering engine, optimized with sprite sheets
- Cross-domain communication via postMessage API

Confetti Full Stack Engineer

Dec 2022 - Oct 2024 · Gaming · Taipei (Hybrid)

REACT NEXT.JS TAILWIND CSS

[confetti.studio](#) ↗

- Y2K landing page

Cashing Platform

- Built and iterated payment and cash-out flows across multiple product lines

SCMP Frontend Engineer

Oct 2021 - Nov 2022 · Media · Hong Kong (Remote)

South China Morning Post: high-traffic international news platform, delivered fully remote

VUE NEXT.JS REACT

[scmp.com](#) ↗

- Improved Core Web Vitals (LCP, CLS), Google's SEO ranking signals, on scmp.com, a high-traffic international news site: fixed the homepage hero's layout shift, lazy-loaded below-fold images, and tuned SSR data prefetch
- Built the site-wide tracking plan across sections: GA events through the GTM dataLayer for traffic, and Mixpanel via SDK keyed on the reader's uid for per-user product behavior
- Applied GDPR right-to-erasure in the comment system: surfaced a gdpr_erased flag through the GraphQL layer so erased users' names render as Anonymous

Futuresai Frontend Engineer

Nov 2020 - Oct 2021 · Finance · Taipei (Hybrid)

REACT NEXT.JS EMOTION FIREBASE

[futures-ai.com](#) ↗

- Built a subscription-billing system with multiple tiers
- Live trading strategy articles with graphical analysis
- Algorithm-driven financial insights

Dentalltw Frontend Engineer

Jul 2018 - Nov 2020 · Healthcare · Taipei (Hybrid)

Built a 0-to-1 clinic product: a desktop app for Taiwan and a React web app for the Vietnam market

REACT REDUX C#/.NET DOCKER GCP

[Dentall Clinic Management](#) ↗

- Built the desktop clinic app (UWP, C#/.NET) for registration, appointments, billing, and prescriptions, integrated with Taiwan's NHI (National Health Insurance) system
- Built Taiwan's first SVG-based dental chart for procedure documentation

Vietnam Market Expansion

- Built the Vietnam web app (React, Redux): the clinic software localized, with multi-language support and SMS

CI/CD Pipeline

- Set up CI/CD to build and push Docker images to GCR, using a Go service and GitLab scripts

SAVY Frontend Intern

Apr 2018 - Jul 2018 · Taipei (Hybrid)

REACT

Community Help Board

- A SPA for posting and browsing local community help requests

PROJECTS

Palimpsest [↗](#)

A boilerplate for giving an AI agent a governed self. The identity file models you, not a persona, and shell hooks enforce the rules the model cannot talk its way out of.

[ANGULAR](#) [TYPESCRIPT](#) [BASH](#) [CLAUDE](#) [CODE](#)

- Three governance speeds in one charter: a bottomline no in-session pressure can move, principles that shift only on new evidence, and a free drift layer.
- Enforcement lives outside the model — a shell hook refuses the write when text hits the blocklist, instead of asking the model to comply.
- An Angular dashboard mapping 11 "AI soul" projects on two axes, built by cloning each repo and reading its identity files: 5 of the 11 enforce their constraints, the rest only declare them.
- trials/ treats self-claims as hypotheses — predictions are hashed and sealed before the answers arrive, then scored against them.

Game of Life [↗](#)

Conway's Game of Life running on the GPU.

[WEBGL](#) [TYPESCRIPT](#)

- Simulated 770K+ cells at 60fps with a WebGL fragment-shader pipeline

Innies [↗](#)

A playable Lumon MDR number-sorting game from Severance (人生切割術).

[REACT](#) [TYPESCRIPT](#)

- Recreated the macrodata-refinement interface as an interactive, playable piece

Kubelens [↗](#)

If you have kubectl, you have Kubelens. Nothing to install.

[ANGULAR](#) [TYPESCRIPT](#)

- Interactive graph of how Deployments, Pods, Services, and Ingresses connect.
- A workspace modeled on macOS desktops: drag any resource into its own panel and run rollouts right there.
- Snapshot the whole cluster to browse offline.
